3. In the Claims, the following amendments have been made:
  21. (Currently Amended) A method for comparing cache memory data in a digital processing system with a test data string, the method comprising:  
receiving an instruction to perform a compare operation, said instruction comprising a starting address and a test data string for use in said compare

operation;

routing the instruction to a data string manipulation circuit;

routing the starting address for use in the compare operation from the data string manipulation circuit to a cache memory;

aligning the test data string with an offset of the starting address prior to  
said compare operation;

comparing the test data string with cached data stored in a cache line of the cache memory, wherein said test data string comprises fewer bytes than the cache line; and

routing an address of at least a portion of the cached data stored in the cache line of the cache memory that matches the test data string to the data string manipulation circuit.

31. (Currently Amended) A method for comparing a string of data in a cache memory with a test data string, the method comprising:

receiving an instruction to perform a compare operation, said instruction comprising a starting address for use in said compare operation;

routing the instruction to a data string manipulation circuit;

routing the starting address for use in the compare operation from the data string manipulation circuit to a cache memory array;

aligning a test data string with data stored in the cache memory array prior to said compare operation;

comparing the test data string with the data stored in the cache memory array; and

routing an address of cached data matching the test data string to the data string manipulation circuit.

39. (Currently Amended) A cache memory comprising:

a data source means for storing a test data;

a cache memory means for storing at least one cache line comprising a plurality of bytes of data;

a means for comparing the test data with the plurality of bytes of data, the means for comparing coupled to the data source means and to the cache memory means; and

a means for decoding coupled to the means for comparing, wherein the means for decoding is capable of identifying respective addresses of multiple ones of the plurality of bytes of data of the cache line that match at least a portion of the test data.
